

BROADENING THE BIOINFORMATICS INFRASTRUCTURE

We reach out to the microbial, plant and livestock science communities. This can be done by either filling out an online Test Case Form, the Test Case template, or by contacting any of the AllBio partners.

COORDINATION THROUGH COLLABORATION

Work with generic bioinformatics and also the design of novel software and databases require structure and coordination with national researchers in life sciences and carry these collaborations to an international level.

EUROPEAN DIMENSION

The databases, software and human expertise needed are not available at any national level and thus AllBio take place at a Europe-wide scale to greatly enhance success and longevity of the project.
